

SAC '22 Code Challenge 2 P4 - Cookie Galore

Time limit: 1.0s **Memory limit:** 256M
Python: 4.0s

After dealing with his N by M grid for too long, Santa asks you to find the minimum number of cookies he must eat to travel from $(1, 1)$ to (N, M) .

He can also only travel to cells that share a side with his current cell (i.e., not diagonally).

Each cell can either be an open space, denoted by $\square$, or a cookie, denoted by C .

Whenever he enters a cell with a cookie, he always eats it.

Since Santa wants to maintain his slim figure, help him find the minimum number of cookies he needs to eat to travel from the top-left corner to the bottom-right corner!

Input Specification

The first line will contain N ($1 \leq N \leq 1\,000$) and M ($1 \leq M \leq 1\,000$), the number of rows and the numbers of columns in his grid.

The next N lines will each contain M cells.

Output Specification

Output the minimum amount of cookies that must be collected to travel from $(1, 1)$ to (N, M) .

Sample Input 1

```
6 4
C..C
.CCC
CC.C
..CC
CC..
C.C.
```

Sample Output 1

```
3
```

Sample Input 2

```
5 5
.....
..CC.
.....
.....
.....
.....
```

Sample Output 2

```
0
```
